Automatic Segmentation

Artificial Intelligence (AI) and deep learning make the segmentation absolutely effortless. Segmenting grains using manual thresholding can be very tricky and tedious – this is now past.

➢ One-click detection

Automatic and complete image segmentation without complicated workflows is provided by just one-click using AI in NIS-Elements.
➢ Sample type flexibility

AI network can recognize grains on wide variety of images as it has been trained on large amount of samples.

Reliable AI grain detection currently works primarily Aluminium structures and similar material samples observed in polarized light with or without lambda plate.

Additional image samples are being continually added into the AI network to offer customers the best and the most comfortable grain segmentation on the market.

Already pretrained for you

And the best part? Grain Size AI detection in NIS-Elements comes already ready to use! Simply click and the AI detection will do the work for you all by itself.

Customize your own AI

Do you have samples you would like to achieve better results on? Create your own custom AI for specific samples using the NIS-Elements NIS.ai module to get the best results possible.

Automatic complete grain size results with just one-click
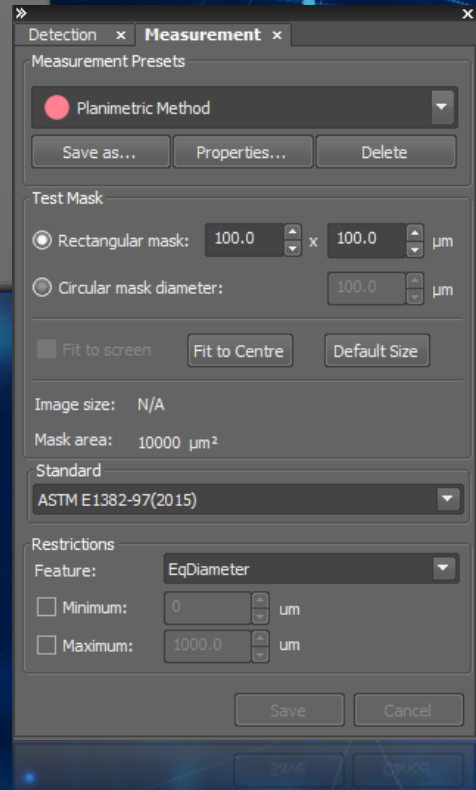

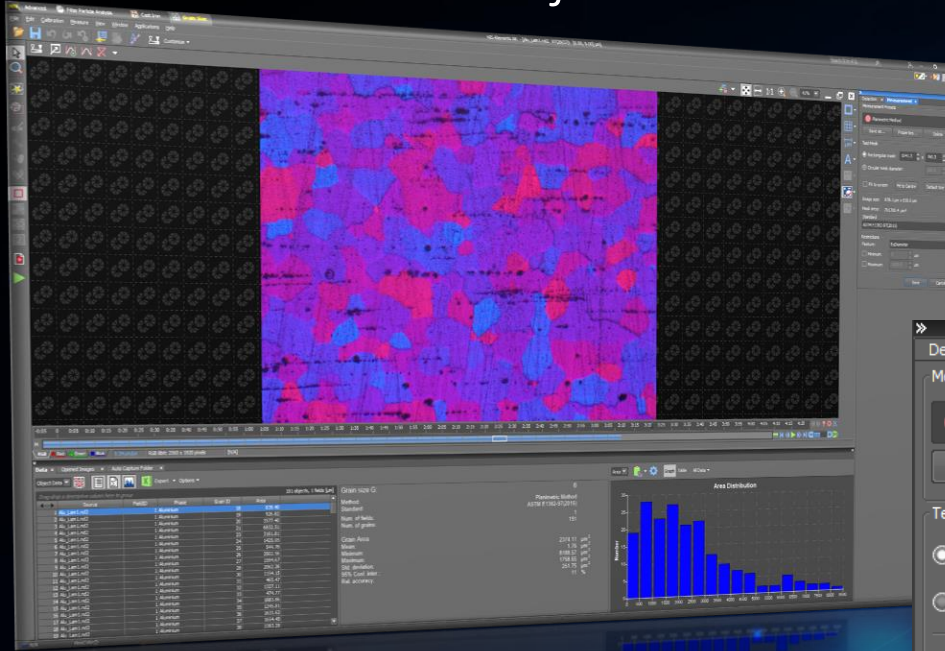

Various measurement methods including the Planimetric and the Abrams method.

In accordance with:
ASTM E1382-97 and E112-13
JIS G0551
ISO 643
GB/T 6394

Complete measurement results in Report including the number of measured fields or images, the number of grains and the grain area (mean, minimum and maximum) using NIS-Elements
